Overview

Are bidirectional energy storage inverters safe?

The use of bidirectional energy storage inverters is crucial for enhancing power exchange in hybrid Alternating Current/Direct Current (AC/DC) networked microgrids [1, 2]. But the switching between grid-connected and off-grid modes of bidirectional energy storage inverters can cause shock effects, impacting the safety of load power consumption.

What is a bidirectional energy storage converter?

The bidirectional energy storage converter in the power grid must possess the capability for seamless switching between grid-connected and islanding modes to cope with frequency and voltage dips resulting from unforeseen circumstances in the main grid.

Can droop control be used to synchronize a bidirectional energy storage inverter?

Conversely, during the transition from islanded to grid-connected mode, this paper proposes a composite pre-synchronization control strategy based on droop control, which enables precise tracking of the phase, amplitude, and frequency of the output voltage of the bidirectional energy storage inverter relative to the grid voltage.

What are the switching strategies for bidirectional energy storage converters?

Currently, there are two primary switching strategies for bidirectional energy storage converters: one is the switching strategy combining PQ control and V/f control, and the other is the switching strategy based on droop control [3, 4, 5, 6].
