

# **BESS Power Station Produced by Boston Communications**

## Overview

---

What is a Bess battery?

BESS are large, stationary batteries used to store energy from the grid, often from renewable energy sources. They provide power to the grid during power outages or fluctuations and during peak demand periods. They are also used to provide power when renewable energy sources cannot — at night or when winds are low.

How does a Bess work?

During peak energy demand or when the input from renewable sources drops (such as solar power at night), the BESS discharges the stored energy back into the power grid. A BESS, like what FusionSolar offers, comprises essential components, including a rechargeable battery, an inverter, and sophisticated control software.

Does Bess apply to all types of energy storage systems?

These regulations do not necessarily apply to BESS specifically but to all types of energy storage systems. Other general codes and regulations for power equipment safety also apply to BESS, like codes from the International Code Council (ICC) and National Electric Safety Code (NESC).

What is a battery energy storage system (BESS)?

Overview. Battery energy storage systems (BESS) use rechargeable battery technology, normally lithium ion (Li-ion) to store energy. The energy is stored in chemical form and converted into electricity to meet electrical demand.
