

High temperature energy storage power generation

Overview

What is high-temperature energy storage?

In high-temperature TES, energy is stored at temperatures ranging from 100°C to above 500°C. High-temperature technologies can be used for short- or long-term storage, similar to low-temperature technologies, and they can also be categorised as sensible, latent and thermochemical storage of heat and cooling (Table 6.4).

What is high-temperature thermal storage (HTTs)?

High-temperature thermal storage (HTTS), particularly when integrated with steam-driven power plants, offers a solution to balance temporal mismatches between the energy supply and demand. However.

What is a high-temperature thermal-storage combined-cycle power-generation system?

The high-temperature thermal-storage combined-cycle power-generation system is mainly composed of a high-temperature N₂-turbine unit, steam-turbine unit, waste-heat boiler and other equipment.

What is high temperature thermal energy storage?

Of all components, thermal storage is a key component. However, it is also one of the less developed. Only a few plants in the world have tested high temperature thermal energy storage systems. In this context, high temperature is considered when storage is performed between 120 and 600 °C.
