

Is the voltage source inverter suitable for grid connection

Overview

What is a voltage source inverter?

Abstract: The voltage source inverter is mainly used for grid interfacing of distributed generation systems. In order to boost the voltage of a renewable energy source to the required dc voltage level, a dc-dc converter is necessary even though the cost and complexity of the system are increased.

Why do we need grid-connected inverters?

The new power system has motivated the evolution of grid-connected inverters (GCIs) to provide grid-support services [3, 4], which has put forward further requirements for the small-signal stability, power-response performance, and grid-support capability of GCIs.

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

What are the parameters of a grid-connected inverter system?

Parameters of the grid-connected inverter system. The simulations of the steady-state operations are carried out when the MPC method is used. The given active power is 1000 W, and the given reactive power is 0 Var. The grid-connected currents are shown in Fig. 13.7A, and the spectrogram of the currents is shown in Fig. 13.7B.
