

# **Lng power station generator set BESS**

## Overview

---

What is N+Bess power generation for LNG plant?

The electrical power generation for LNG plant typically has a spinning reserve philosophy of “N+1” Gas Turbine Generators (GTGs). An abatement opportunity is the replacement of part-load GTGs with a Battery Energy Storage System (BESS), allowing the plant to turn off the operating spare power generation unit and operate as (N+BESS).

Can Bess react sufficiently fast to stabilise the electrical system of a LNG plant?

BESS FUNCTIONALITY Electrical system studies were carried out to confirm that BESS could react sufficiently fast to stabilise the electrical system of an LNG plant in case of a trip of a running power generation unit.

How does a Bess system work?

The BESS acts as a dynamic energy reservoir and power provider. It efficiently accumulates excess energy generated by the solar panels or surplus power produced by the generator. When the battery is full, the system discharges the stored energy to ensure a stable and continuous power supply.

Do LNG plants generate their own power?

LNG plants, therefore, often generate their own power. To deal with the planned and unplanned downtime of the power generation unit, an LNG plant has a “spinning reserve” philosophy of at least N+1 operational gas turbine generators so that a trip of one power generation unit does not cause a total power failure.
