Overview

How do mobile base stations work?

Mobile base stations are normally hooked up to the power grid, using that electricity to amplify the cell signal to the broader area. During a power outage, an on-site battery kicks in to keep the tower running. If the outage persists, a crew could arrive with a diesel generator to keep powering the tower.

What is a mobile phone base station?

A mobile phone base station is a telecommunications infrastructure used to send and receive RF signals from mobile phones. The frequencies used typically range from 900 MHz to 2.45 GHz, with powers varying from 1 W for indoor antennas to 40 W for those at high elevations.

What power devices does St offer?

ST provides a complete power device portfolio, including IGBTs, thyristors, power rectifiers and MOSFETs, power modules and system-in-package (SiP) solutions to make mobile base stations more energy-efficient. Our broad range of inertial and environmental MEMS sensors can also enhance the functionality of base transceiver stations.

What is an active antenna system (AAS) in a mobile base station?
