

Small power generation system solar energy

Overview

What is hybrid solar-biomass power production system (HSBP)?

The development of reliable and sustainable energy sources is indispensable to support the fast-growing energy demand globally. Integrated solar energy systems and biomass technologies can be utilized to develop a small-scale power generation system. It is commonly known as a hybrid solar-biomass power production system (HSBP).

How much power does a solar-biomass system produce a year?

The average biomass power generation is approximately 34.5 GW h, while the annual average is about 33.7 GW h. Similarly, the solar power peak reaches around 9.4 GW h, with an average net power of about 8.3 GW h. The combined solar-biomass system for power generation shows superior net power output over the year due to several key factors.

Why is a combined solar-biomass system better than a biomass system?

The combined solar-biomass system for power generation shows superior net power output over the year due to several key factors. The combined nature of biomass and solar power strengthens reliable power delivery since biomass generates steady electricity while solar contributes substantial power output during periods of sun.

What is the exergy efficiency of a combined solar-biomass plant?

Exergy efficiency of the combined solar-biomass plant. A combined solar-biomass system that incorporates TES and Syltherm oil manages to reach an exergy efficiency peak of 59.3%. The performance of Thermal oil exceeds that of Therminol VP1 for the storage of heat and heat exchange functions.
