## Overview

---

Do PV modules need to be corrected?

Correction of PV modules' current-voltage characteristics (I - V curves) is essential before they can be used for performance analysis and fault diagnosis under real-life conditions. IEC 60891 (version 2021) has updated Procedure 2 and proposed a new correction Procedure 4 compared to the 2009 version.

How to determine PV cells and modules parameters precisely?

A new and simple computational approach based on approximation and correction technique (ACT) was proposed to determine PV cells and modules parameters precisely. Furthermore, a novel user-friendly software application was developed to extract these parameters.

Do spectral correction functions affect PV performance?

Failing to account for the spectral influence on PV performance can lead to weekly errors of up to 14% even for relatively stable technologies such as polycrystalline silicon. There exist a range models, known as spectral correction functions (SCFs), to account for the spectral influence on PV performance forecasts.

How can act model the I-V behaviour of a solar module?

The extracted parameters were discerned to be  $n = 1.26881$ ,  $R_s = 6.39445 \Omega$ ,  $R_p = 1973.35 \Omega$ ,  $I_\lambda = 0.15449 \text{ A}$  and  $I_o = 2.50879 \text{ nA}$ . It was asserted that the ACT could effectively model the I-V behaviour of the module with a RMSE of  $8.3839\text{E-}4$  and extracted the solar cells parameters in a superior way compared to the one used for the PV modules.
