

Solar energy storage accepts peak load

Overview

Do PV storage systems mitigate peak loads?

The results indicate that PV storage systems effectively mitigate system peak loads, thereby enabling conventional generators to fulfill the requisite energy demand for DA UC while maintaining the minimum contingency margin and preventing overload.

What is the peak load demand of a solar system?

It can be observed from Fig. 4 that the peak load demand of the system is 1500 MW at 12th hour. The next subsequent peak of 1400 MW is observed at 20th hour of the next day. In this case study, load uncertainty is introduced on the maximum side, with the upper bound established as mentioned in Eq. (18), in the absence of PV-ES.

Can a company provide supplemental power to avoid peak loads?

For some industries, and their production's proper functioning, changing the load profile can be difficult. However, a company can provide its own supplemental power to avoid peak loads. Additional power could come from alternative sources such as an energy storage system, gensets, and/or power plant.

What is the research gap between Da UC and peak load management?

The next research gap arises from the insufficient analysis of peak load management in conjunction with DA UC. Effective management of peak loads is a vital component of system reliability, especially as variable renewable energy sources, such as solar photovoltaic (PV) and wind power, increasingly penetrate the grid.
