

# Solar panel battery constant voltage module

## Overview

---

Do solar PV and battery storage support stand-alone loads?

Both solar PV and battery storage support stand-alone loads. The load is connected across the constant DC output. A solar PV system operates in both maximum power point tracking (MPPT) and de-rated voltage control modes. The battery management system (BMS) uses bidirectional DC-DC converters.

How does a solar PV battery management system work?

When the battery is fully charged and the load is less than the PV power, the solar PV operates in constant-output DC bus voltage control mode. The battery management system uses a bidirectional DC-DC converter. A buck converter configuration and a boost converter configuration charge and discharge the battery, respectively.

How to choose a PI controller for a solar PV system?

Select a proper PI controller proportional gain,  $K_p$ , and phase-lead constant,  $\tau$ . Both solar PV and battery storage support stand-alone loads. The load is connected across the constant DC output. A solar PV system operates in both maximum power point tracking (MPPT) and de-rated voltage control modes.

How to control a solar PV plant if the battery is not fully charged?

Set the variant variable MPPT to 0 to choose the perturbation and observation MPPT. Set the variable MPPT to 1 to choose incremental conductance. This example uses a boost DC-DC converter to control the solar PV power. When the battery is not fully charged, the solar PV plant operates in maximum power point.
