## Overview

---

What is a rooftop solar photovoltaic system?

A rooftop solar photovoltaic (PV) system uses solar panels mounted on the roof of a building to convert sunlight into electricity. Rooftop solar systems rely on the photovoltaic effect, where cells generate electricity in response to sunlight.

Why are solar panels placed on the roof of a house?

One of the biggest reasons why solar panels are placed on the roof of a house is to reduce the carbon footprint of the home. By using solar power, homeowners significantly decrease their reliance on fossil fuels and lower their overall environmental impact. Let's explore how solar panels contribute to a greener, more sustainable future. 1.

Should you put solar panels on the roof of a house?

The roof of a house offers the most unobstructed access to sunlight throughout the day. By placing solar panels on the roof of a house, homeowners can ensure that the panels receive the maximum amount of sunlight possible, which is essential for optimal energy production.

How do rooftop solar panels work?

Rooftop solar systems work by harnessing the photovoltaic effect. This phenomenon occurs when sunlight hits the multiple cells within solar panels, generating an electric current. By placing panels on a rooftop, solar panels are optimally exposed to sunlight and produce enough electricity to power homes and buildings.
