Overview

What are solar panels?

Solar panels are devices designed to absorb sunlight and convert it into usable electricity. They are a cornerstone of solar energy systems and can be found on rooftops, in solar farms, and at other installations around the world.

How do solar panels work?

The flow of electricity results from the characteristics of the semiconductors and is powered entirely by light striking the cell. The main component of a solar panel is a solar cell, which converts the Sun's energy to usable electrical energy. The most common form of solar panels involve crystalline silicon -type solar cells.

What makes a solar panel unique?

Modern solar panels are marvels of engineering, consisting of multiple layers designed to maximize light absorption and electrical generation while withstanding decades of outdoor exposure. The heart of every solar panel is the photovoltaic cell, typically made from crystalline silicon.
