

# Solar panels in series power generation

## Overview

---

Connecting two solar panels in series doubles your system's voltage while maintaining the same current flow - a crucial setup for maximizing power output in home solar installations. Why are solar panels wired in series?

Solar panels are wired in series when you want to increase the total voltage in a system. In this configuration, the voltage outputs of all panels add up while the current remains low on a level of what a single solar panel can provide. Connecting solar panels in series increases the total voltage in a system way over the safe level.

What if two solar panels are connected in series?

So, if you connect two solar panels with a rated voltage of 40 volts and a rated amperage of 5 amps in series, the voltage of the series would be 80 volts, while the amperage would remain at 5 amps. Putting panels in series makes it so the voltage of the array increases.

Do solar panels use parallel connections?

Yes, many solar systems use a combination of series and parallel connections to optimize voltage and current levels for the inverter and other components.

Should solar panels be wired in series?

The most common scenarios where people choose to wire solar panels in series include: 1. Home grid-tied systems. Grid-tied solar installations often require a specific voltage range for the inverter to function efficiently. Wiring panels in series can help achieve this level. 2. Long cable runs.
