

# **Test items for container energy storage batteries**

## Overview

---

Three installation-level lithium-ion battery (LIB) energy storage system (ESS) tests were conducted to the specifications of the UL 9540A standard test method [1]. Each test included a mocked-up initiating ES.

What is a lithium-ion battery energy storage system?

1. Objective Lithium-ion battery (LIB) energy storage systems (ESS) are an essential component of a sustainable and resilient modern electrical grid. ESS allow for power stability during increasing strain on the grid and a global push toward an increased reliance on intermittent renewable energy sources.

How many ESS unit racks are in a standard size container?

Each test included a mocked-up initiating ESS unit rack and two target ESS unit racks installed within a standard size 6.06 m (20 ft) International Organization for Standardization (ISO) container. All tests were conducted with an identical LIB configuration.

Which sensors were used to analyze gas composition throughout container?

Various laboratory- and industrial-grade sensors were used to characterize the gas composition throughout container. A National Instruments SCXI-1001 chassis, SCXI-1600 DAQ controller, SCXI-1102 voltage input multiplexer, and a SCXI-TC2095 thermocouple input module were used to collect the data from the listed sensors.

What instruments were used to analyze the gas composition inside a container?

A combination of analytical instruments and common industrial gas detectors were used to characterize the gas composition inside the container. Gas samples near the ceiling and floor were extracted from the container and transported by heated lines to analytical instruments.
