

# The solar inverter waits for 60 seconds

## Overview

---

How much time does a solar inverter take to synchronize?

The inverter has 60 changes per second to sync with the grid. Sometimes it might be needed to observe the grid but still, 5 minutes is too much time and missed opportunities to synchronize: Am I missing something?

My inverter is Delta SOLIVIA Solar Inverter 3.8 TL.

How long should an inverter wait?

The standard does not directly address it, but from a lab perspective, common practice is to have the inverter wait a minimum of 5 minutes after the Area EPS steady-state voltage and frequency have been restored. Further comments indicate that some European countries require 3 minutes and Australia requires 1 minute.

How to test a DC switch on a solar inverter?

[Photo] SN number of the inverter Confirm the DC Switch is turn on. Step1: Measuring the voltage on the PV side with a multimeter, ensure the red probe is connected to the positive terminal and the black probe to the negative terminal. The correct measurement should be a positive number within the MPPT range.

How long does it take a solar inverter to restart?

When PV module type is set to CPV 1, the solar inverter can quickly restart in 60 minutes if the input power of PV modules drops drastically due to shading. When PV module type is set to CPV 2, the solar inverter can quickly restart in 10 minutes if the input power of PV modules drops drastically due to shading.
