

Uninterruptible power supply is UPS

Overview

What is an uninterruptible power supply (UPS)?

An Uninterruptible Power Supply (UPS) is defined as a piece of electrical equipment which can be used as an immediate power source to the connected load when there is a failure in the main input power source. In a UPS, the energy is generally stored in flywheels, batteries, or super capacitors.

What is a ups & how does it work?

What Is a UPS?

A UPS, or an uninterruptible power supply system, is an electrical device designed to provide emergency power to a load when the input power source fails. Not to be confused with an auxiliary or emergency power system, a UPS provides near instantaneous protection from input power outages via battery power [source: USAID].

How does a ups protect a device from sudden power failure?

An uninterruptible power supply (UPS) protects valuable devices from sudden power failures by providing backup power during power outages. This ensures a steady power supply to connected devices.

Are UPS uninterruptible?

UPSes aren't uninterruptible. They're electrical or mechanical devices, so they not only require routine maintenance, but also are subject to component failures. For these reasons, all UPS systems have a built-in bypass to route incoming power around the system and directly to the ITE when necessary.
