What is a solar inverter?

Let's talk more about what is a solar inverter. A solar inverter is a precious component of the solar energy system. Its primary purpose is to transform the DC current that the panels generate into a 240-volt AC current that powers most of the devices in your place.

How does a solar inverter work?

A solar inverter does a great job of absorbing variable DC output from the panels and converts this current into a 120 or 240-volt AC output. The purpose of inverter is to replace the DC output that is accumulated by the solar panels. Please note that the different devices or appliances at your place operate on AC, not DC.

Do solar panels need an inverter?

Without an inverter, the energy generated by your solar panels would be completely useless for your home. As the saying goes, "when installing solar panels, there is no power until you connect to the inverter." Not all inverters are created equal. The type you choose will fundamentally impact your system's performance, cost, and future-readiness.

Can a solar inverter power a battery?

Solar inverters convert the direct current (DC) energy from a solar panel into alternate current (AC) energy appliances use. It's also important to note that solar batteries store DC energy. Before you can use the energy in a battery to power an appliance, it has to be converted to AC energy using an inverter.
