

What is a shingled solar panel

Overview

What are shingled solar panels?

Shingled solar panels should not be confused with solar shingles used in photovoltaic energy applied to construction (see figure 3). As already mentioned, solar shingles are nothing more than shingles made of photovoltaic cells, and these products replace the conventional roof.

What is a shingled solar module?

A shingled solar module is a type of photovoltaic module in which conventional solar cells are connected in a stacked fashion by some technique. To make a shingled solar panel, conventional solar cells are mainly cut into strips and then connected using a conductive adhesive to make them overlap, similar to stacking shingles on a roof.

Why are shingled solar panels so popular?

Obviously, the main reason why shingled solar panels are gaining fame over traditional ones is their increased efficiency. The shingled design reduces the space between cells. This allows for more solar cells to fit in the same space, increasing the active surface area for capturing sunlight to 95.2%.

How do shingle solar panels work?

This creates strings that are arranged into a panel structure. In other words, shingled solar panels are attached to the roof using the structural support from the existing roof to place the shingle solar cells (just like traditional modules) while the solar shingles replace your roof itself.
