

# Why can't the site charge lithium batteries

## Overview

---

Your lithium battery may not charge due to BMS failure, a faulty charger, deep discharge, cable damage, or cell degradation. What if a lithium battery won't charge?

Lithium-ion batteries have become an integral part of our daily lives, powering everything from smartphones to electric vehicles. However, like any other battery technology, they can malfunction and refuse to charge. If you're facing this issue, don't worry - in most cases, a lithium battery that won't charge can be fixed.

What happens if a lithium ion battery is drained?

Deep discharging, where the battery is completely drained to 0% capacity, can cause damage to the battery cells. This can prevent the battery from charging or holding a charge. Like any other battery technology, lithium-ion batteries degrade over time due to wear and tear.

What happens if a lithium battery is damaged?

If a lithium battery has experienced serious damage, the internal BMS won't allow the battery to do anything. It won't accept a charge or provide any power. This is a safety mechanism that keeps you, your vehicle, and your family safe from anything that might not be wired right in your rig.

What should I do if my lithium battery is not picking up charge?

If your lithium battery is not picking up the charge, you can do a few things to revive your battery. If your lithium-ion battery has been sitting idle for a long time and now is not picking up the electric current, you can use a low-volt charger. For example, a 48V/20A charger for a 60V/20A battery is a good choice for an idle battery.

## Why can't the site charge lithium batteries
